

Build an EF and ASP.NET Core 3.0 App HOL

Lab 0

Welcome to the Build an Entity Framework Core 3.0 and ASP.NET Core 3.0 Application in a Day Hands-On Lab. Prior to starting the rest of the workshop, you must have .NET Core 3.0+ SDK, .NET Core 3.0+ runtime, Docker Community (or SQL Server), and an appropriate IDE installed. Supported IDEs includes:

- Visual Studio 2019 16.3+
- Visual Studio for the Mac 8.3+
- Visual Studio Code 1.38.1+

SQL Server Management Studio is recommended.

Part 0: Permissions

You must have admin permissions on your machine to complete this hands-on lab.

Part 1: Installing the Prerequisites

Step 1: Install/Confirm .NET Core Runtime and SDK

- 1) Download and install the latest 3.0 .NET Core SDK and Runtime from <http://dot.net>.
 - a) For Visual Studio 2019 Mac (8.3) download SDK 3.0.100
 - b) For Visual Studio 2019 Windows (16.3.X) Mac (8.0) download SDK 3.0.100
 - c) For Visual Studio Code (or any other IDE) download SDK 3.0.100

- 2) Open a command window and type:

where dotnet

- 3) After unpacking some files, it should respond with:

C:\Program Files\dotnet\dotnet.exe

- 4) You might also see the following (not required for this course):

C:\Program Files (x86)\dotnet\dotnet.exe

- 5) Check the version of the .NET Core Runtime by entering:

dotnet --list-runtimes

- 6) The response will be (at the time of this writing):

```
Microsoft.AspNetCore.App 3.0.0 [C:\Program Files\dotnet\shared\Microsoft.AspNetCore.App]  
Microsoft.NETCore.App 3.0.0 [C:\Program Files\dotnet\shared\Microsoft.NETCore.App]
```

- a) Microsoft.AspNetCore.App leverages the ASP.NET Core shared framework. Any assets in the ASP.NET Core shared framework will not be deployed with your app, and are pre-compiled for

All files copyright Phil Japikse (<http://www.skimedic.com/blog>)

better application startup time. Microsoft.AspNetCore.App also uses version roll-forward to work with later versions of the 3.x framework installed on the target machine.

7) Check the version of the .NET Core SDK by entering:

```
dotnet -list-sdks
```

8) The response will be (at the time of this writing):

```
3.0.100 [C:\Program Files\dotnet\sdk]
```

Step 2: Install an IDE

The HOL will work with Visual Studio 2019, Visual Studio for the Mac, or Visual Studio Code. JetBrains Rider can also be used.

Option 1: Download and install Visual Studio 2019 16.3+

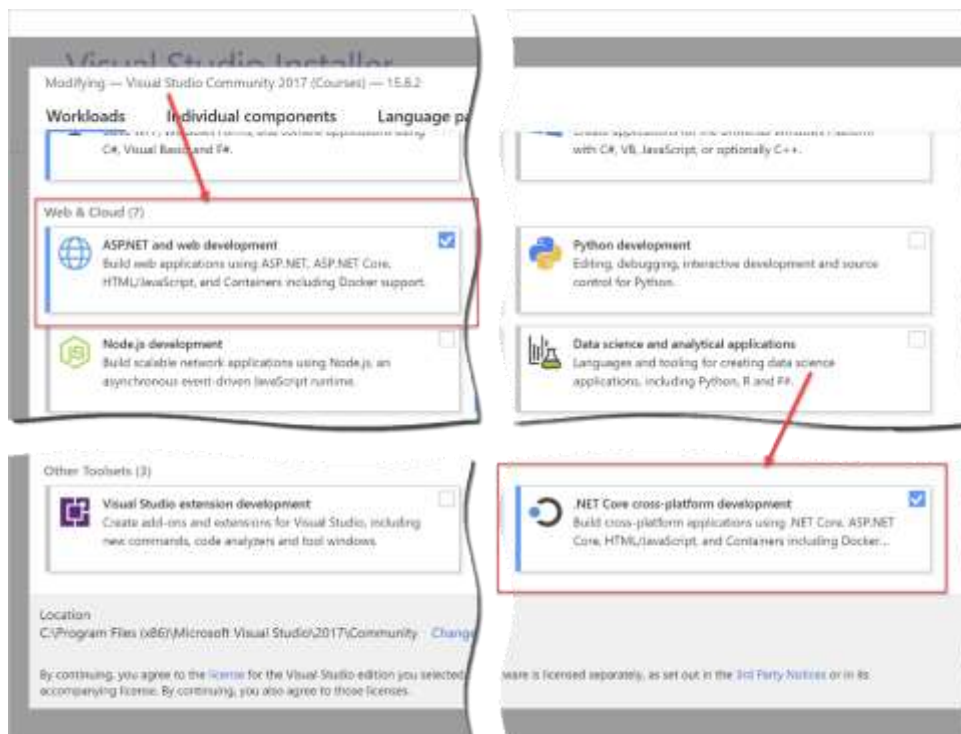

1) Download Visual Studio 2019 16.3+ (any edition) from the Visual Studio home page:

<https://www.visualstudio.com/en-us/visual-studio-homepage-vs.aspx>

a) The Community Edition is free, and has everything you need to complete this Hands-On Lab

2) Start the installer

a) The new installation experience has separate workloads based on what type of work you intend to do. For this lab, select the “**ASP.NET and web development**” workload as well as the “**.NET Core cross-platform development**” workloads.

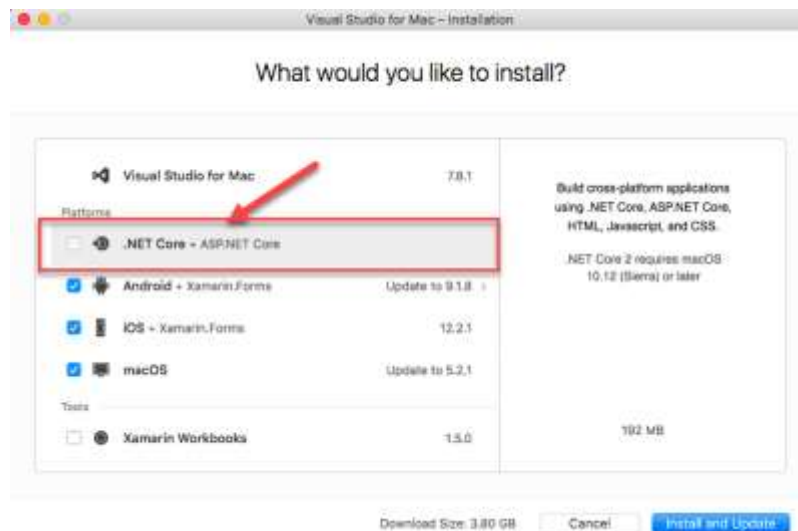

Option 3: Download and install Visual Studio Code 1.38.1+

- 1) Download Visual Studio Code from <https://visualstudio.microsoft.com/>.
- 2) Install the “Microsoft C# extension (powered by OmniSharp)” extension.
- 3) Install the “C# IDE Extension for Visual Studio Code” extension
<https://marketplace.visualstudio.com/items?itemName=jchannon.csharpextensions>

Option 4: Download and install Visual Studio for the Mac (8.3+)

- 1) Download Visual Studio for the Mac from <https://visualstudio.microsoft.com/>
- 2) Select .NET Core from the install screen (image from 7.8.1)

Step 2: Download and install SQL Server Tooling

Windows: Download/Install SQL Server Management Studio (SSMS)

This is not required for the workshop, but makes it easier to work with the database.

- 1) Download and install SQL Server Management Studio 18.1+ from <https://docs.microsoft.com/en-us/sql/ssms/download-sql-server-management-studio-ssms?view=sql-server-2017>
 - a) This is a free tool from Microsoft

Mac: Download/Install Azure Data Studio

This is not required for the workshop, but makes it easier to work with the database.

- 2) Download and install Azure Data Studio 1.12.0+ from <https://docs.microsoft.com/en-us/sql/azure-data-studio/download?view=sql-server-2017>
 - a) This is a free tool from Microsoft

Step 3: Install Docker Community

Docker is a containerization platform that runs on Windows, MacOS, and Linux.

All files copyright Phil Japikse (<http://www.skimedic.com/blog>)

- 1) Download and install Docker Community from <https://www.docker.com/get-started>
 - a) When installing, select Linux containers (and not Windows containers)
 - b) This is a free tool but requires you to have a Docker user id and password
- 2) [Windows] Download and Install Kitematic for Docker by right clicking on the Docker ship in the system tray, click Kitematic, and follow the instructions. Kitematic is a GUI for managing Docker images and containers.
 - a) You might need to pull the install from <https://github.com/docker/kitematic>

Step 4: Pull the SQL Server Image and Create the Local Container

A Docker image is like a class definition, while a Docker Container is like an instance of that class. To run SQL Server in Docker, you must first pull the image from Docker Hub, and then create a container using that image.

- 1) Pull the SQL Server 2017 for Linux (Ubuntu 16.04) image. Enter the following command:

```
docker pull mcr.microsoft.com/mssql/server:2017-latest
```

- 2) When creating an image, there are two required environment variables, "ACCEPT_EULA" and "SA_PASSWORD". An optional environment variable "MSSQL_PID" sets the product version. The host port mapping to the image port needs to be set, and a friendly name added. Create the container using the following command:

- a) **NOTE:** On Windows, use double quotes ("). On Mac and Linux, use single quotes (').

```
docker run -e "ACCEPT_EULA=Y" -e "SA_PASSWORD=P@ssw0rd" -e "MSSQL_PID=Express" -p 6433:1433 --name SpyStoreHol -d mcr.microsoft.com/mssql/server:2017-latest
```

Step 5: [Optional] Download and install SQL Server 2017 Developer Edition (only if NOT using Docker and you don't already have a SQL Server instance installed)

- 1) Download the SQL Server 2017 Developer Edition from <https://go.microsoft.com/fwlink/?linkid=853016>

Part 2: Clone (or Download) the Lab Repo

All of the lab documents and asset files are located here:

https://github.com/skimedid/dotnetcore_hol/tree/master/SingleDayHandsOnLabFiles/3.0

NOTE: To download as a zip, you must be at the root of the repository.

Summary

These are all of the tools you need to complete this Hands-on Lab.
